

Integrated Security System Design

Integrated Security System Design is about the synergy that can be generated from protective security measures. Integration is not just a software package pulling together various electronic systems. It's how hard physical security measures such as fences and doors, work with CCTV and alarms systems, as well as the procedures that there are to mitigate the risk. Integrated Security System Design requires a depth of planning in being able to visualise how to capture each individual component to make them work as one. At RedLeaf Consultancy we help clients to achieve this aim.

Integrated Security System Design is an holistic approach to security, which ensures the synergies that can be derived from all the protective measures working together is achieved

A need for security has to be established as installing equipment or employing security guards without a clear interconnection is unlikely to have a beneficial effect on the attendant risks

RedLeaf Consultancy works with clients from project inception to implementation to ensure the benefits that can be derived from Integrating security systems can be achieved

A Logical Approach

The method of ensuring that an Integrated Security Solution is designed and introduced to mitigate the risk is to follow a logical approach. Working with clients, RedLeaf Consultancy establishes the threat that a business is under and how that threat might exploit weaknesses in the security design. It is from this evaluation process that protective measures can be built up, with outline costs being established. Through seeing the cost of the proposals, when set against the impact that would be made, if the threat was realised, that allows senior management to understand what the risk is and the options to reduce it.

▪ Design Specifications

Whether the entire design is to be tendered, elements of it, or even if it is just for review, it is essential that specifications are drawn up. The specifications will reflect not only the physical and electronic equipment to be installed, the guards to be used and the procedures followed, but how it is envisaged that the security system, in its entirety, will be integrated. RedLeaf Consultancy works with clients to establish those specifications, no matter if they are for inclusion in a tendering process or for internal review.

▪ Implementation

The implementation of an Integrated Security System can be a multidisciplinary process, as different teams from Properties, Human Resources, Procurement as well as external suppliers are pulled in to ensure project success. Through this phase and to final project sign off, RedLeaf Consultancy can assist clients in ensuring that the product is delivered to control the original identified risks.
